

Endocannabinoid removal solution (1 X)

Introduction

Endogenous Biotin Removal Solution (Endocannabinoid removal solution) is designed to effectively remove endogenous biotin. This product is primarily formulated with avidin and deionized water.

Protocol

1. Deparaffinize and hydrate the tissue sections.
2. Immerse the deparaffinized and hydrated tissue sections in Endocannabinoid removal solution (1×) and incubate for 20 minutes.
3. Wash in PBS or Tris buffer for 5 minutes.
4. Proceed with immunostaining steps.

Note

1. If the tissue to be tested is rich in endogenous streptavidin-biotin, consider using a non-streptavidin-biotin detection system.
2. Avoid repeated freeze-thaw cycles, as this may lead to product failure.
3. This product is for scientific use only.
